

One asymmetric reference density, four location-dispersion choices

$$p_{\mu,\sigma}(x) = \frac{1}{\sigma} p\left(\frac{x-\mu}{\sigma}\right), \quad \int_{\mathbb{R}} x p(x) dx = 0, \quad \int_{\mathbb{R}} x^2 p(x) dx = 1$$

(a) Reference density

(b) Shift only

(c) Enlargement only

(d) Shift and enlargement

The reference was normalized, centered, and scaled numerically. Dotted lines mark the means; dashed curves repeat the reference.
