

Gaussian geodesics: moving from $\mathcal{N}(-2, 1)$ to $\mathcal{N}(2, 1)$

Six distributions at $t = 0, 0.2, 0.4, 0.6, 0.8, 1$ along constant-speed geodesics

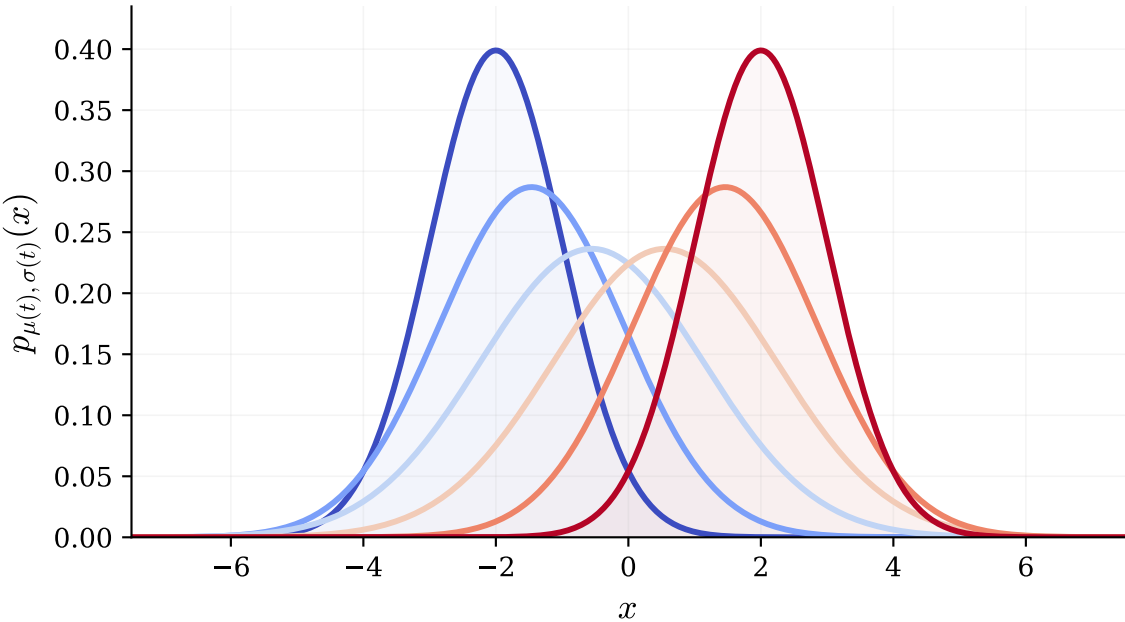

Fisher-Rao within the Gaussian family

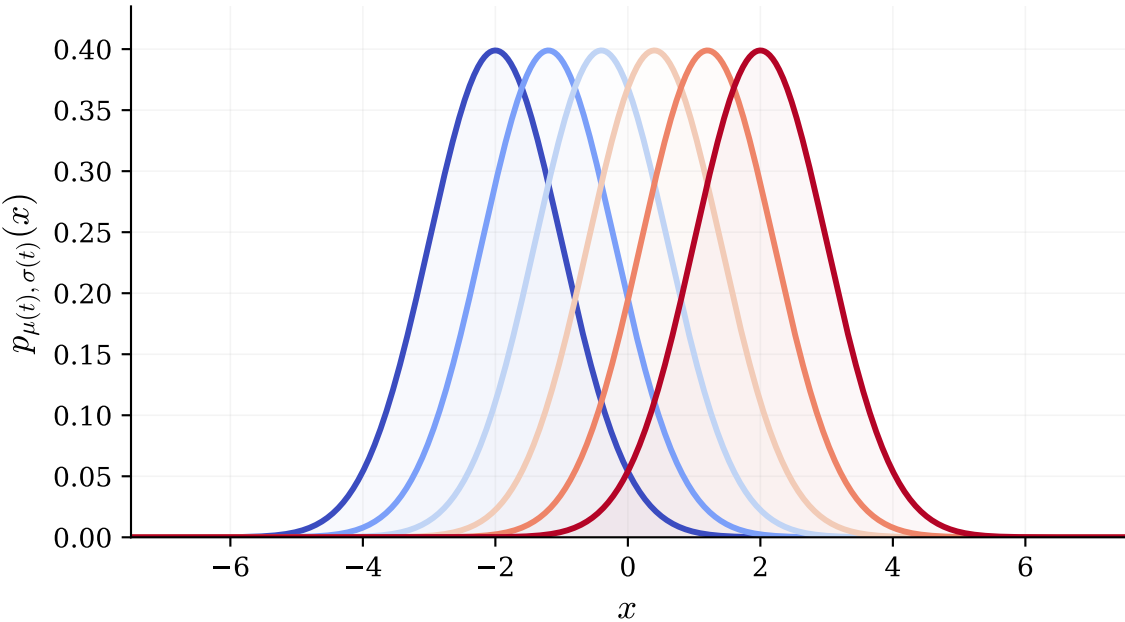

Wasserstein-Otto

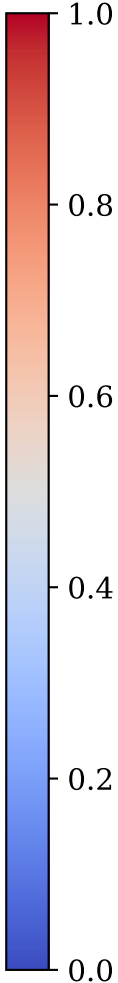

Densities along the geodesic

Densities along the geodesic

Geodesic time t

Fisher-Rao broadens the Gaussian during the transition; Wasserstein-Otto translates it at fixed variance.

Colors match the six parameter points and their densities. Both columns use identical axis limits.
